

# Prove the failure. Claim the sponsor rebate.

A fixed sponsor rebate for a preauthorized reverted transaction.

01

**Failed on Sepolia**

02

**Verified by Attestcoin**

03

**Rebated on Creditcoin**

VERIFIED LIVE RUN

Ticket first. Status 0, zero logs. Native proof. Fixed 1 test CTC paid.

# Give a sponsorship budget a clear rule.

## FOR THE USER

**Show an eligible failure. Claim a known amount.**

Inspect the receipt and the policy instead of asking an operator to interpret the outcome.

## FOR THE SPONSOR

**Authorize exact intent. Bound the payout.**

Set one-use tickets and fund a limited campaign. No blanket promise for every failed transaction.

## PRODUCT HYPOTHESIS

Sponsored recovery may improve onboarding for participating protocols. Demand and retention impact still need validation.

Fixed subsidy. No insurance, full gas reimbursement or fault judgment.

# Attestcoin is in the payment path.

- 01 Authorize** Sponsor issues an exact ticket before the action.
- 02 Fail** Sepolia records a genuine failed receipt.
- 03 Prove** Relayer supplies payload + inclusion/continuity proof.
- 04 Verify** Native 0xFD2 checks payload and source height.
- 05 Pay once** Vault checks status 0, ticket policy and replay.

## REMOVE THE PROTOCOL

Remove the independent remote-failure check that authorizes payment.

# A claim should survive hostile inputs.

**Changed status 0 -> 1**

Native: Merkle proof validation failed.

**Wrong source chain**

Vault: WrongSourceChain.

**Unissued ticket**

Vault: TicketNotIssued.

**Duplicate claim**

Vault: TicketAlreadyClaimed; no second payout.

**Success / intent / reentry**

Additional policy cases covered in local tests.

## 4 live read-only rejection checks

Plus 42 local policy/security cases using a disclosed verifier harness. Authentic success, wrong intent, transfer failure and reentry are local tests. The source review is not a professional audit.

# A failure without logs. A paid rebate.

## FIXED GROSS REBATE

**1 test CTC**

**Net received: 0.9999184485 test CTC**

Claim gas paid: 0.0000815515 test CTC

Ticket: Creditcoin #5,473,617 / confirmed before source broadcast

Failure: Sepolia #11,687,232 / status 0 / zero logs

Claim: Creditcoin #5,473,655 / status 1 / vault balance 10 -> 9

## OBSERVED TIMING

Attestation ready: 8m 54.575s. Native verified: 8m 57.415s.

Claim submission to confirmation: 5.061s.

15-second polling; local observations, not exact publication times or latency guarantees.

CLI executed the transactions. The website provides read-only replay and verification.

# A small pilot. A measurable next step.

First intended users: protocols testing bounded onboarding or retry sponsorship.

## PILOT PROPOSAL

**One protocol. One action. A fixed budget and a clear eligibility rule.**

## PROPOSED MEASURES

Proof latency, claim completion, rejection causes, sponsor spend and retry behavior.

## NEXT GATE

Publish the synchronized demo and evidence. Then validate demand with one sponsor before expanding scope.

One verified testnet run. No claimed traction, partners, revenue or accepted submission.
